

Project Summary

This project is to design a Most Probable Database and construct 7 different functions. Since this is a project under the 'Fundamentals of Programming' course, it is not required to use the library that is out of academic and advanced programming technique. However, I've created a more user-friendly interface by designing the interface and tables accordingly. I also learn more new library functions such as `fstream`, `sstream`, `string`, and `windows.h` to assist me in performing more accurate data validation of user input. After completing this course, I gain very much interest in programming languages and think logically to allow the machine to understand the code.
