

Project Summary

The process can be simplified into 5 processes, which are design brainstorming, calculation, prototype drawing, report writing, and presentation.

I'm in a group of 4 and participated in these processes. The difficulty of this project is to trial and error all the design parts because there are no absolute ways to complete the conveyor system. However, I have learned to select the appropriate machine components according to the specific operation requirement of the system. I have also gained great experience working with a team to complete a mechanical system.
